## What is MyMed?

MyMed is an app to store your patient data. Using MyMed, people have access to all their health history and they can share this with their doctor, family members or even other complementary services through an API.

## Key data used to power MyMed:

MyMed medical record storage is encrypted for your security.

MyMed users must validate their identity to ensure they have permission to store their records with the service. Records may be stored for a minor but only with permission from a parent or guardian.

MyMed may share data with specified partners, other users or family at your request via account linking or an API.
